Data Analytics Project: Railway Gauge Trends

Dataset Used: railway_gauges.csv
This document outlines a structured, end-to-end data analysis project based on railway gauge data. The project is divi **Data Analytics Project: Railway Gauge Trends**

This document outlines a structured, end-to-end data analysis project based on railway gauge data.

Dataset: Railway Gauge Data (Assumed to be in a CSV file)
Project Goal: To analyze historical trends and composition of different railway gauges (Broad, Metre, Narrow) over the years.**Modules Used**

The **primary libraries/modules** required for this project are:

- **Pandas:** For all data manipulation, filtering, aggregation, and feature engineering tasks.
- **NumPy:** Specifically for numerical calculations like yearly growth (`np.diff`).
- **Visualization Library (e.g., Matplotlib):** For generating all required plots (Line Graphs, Bar Charts, Pie Charts, Stacked Bar Charts).

🎯 Project Coverage

Category	Skills Covered
Data Preprocessing	Data Loading, Missing Value Handling, Type Conversion
Pandas Operations	Filtering, Selection, Aggregation, Feature Engineering
NumPy Calculations	Yearly growth calculation (np.diff)
Visualization	Line Graph, Bar Chart, Pie Chart, Stacked Bar Chart

Scenario 1: Basic Data Loading & Cleaning (🟢 Easy)

Description:
This scenario focuses on the initial stage of data analysis, which is data loading and cleaning. The dataset is loaded into a Pandas DataFrame for further processing. Basic exploration is performed by viewing the first few rows and column names. Missing values are identified and handled by replacing them with zeros. Data type conversion ensures all gauge columns are numeric for accurate calculations.

Task	Description
1.	Load the dataset into a Pandas DataFrame.
2.	Display the first 5 rows and column names to understand structure.
3.	Check for missing values and replace them with 0 (assuming missing values represent 0 km of track).
4.	Convert all relevant gauge columns (Broad, Metre, Narrow, Total) to numeric types (e.g., float64 or int64).

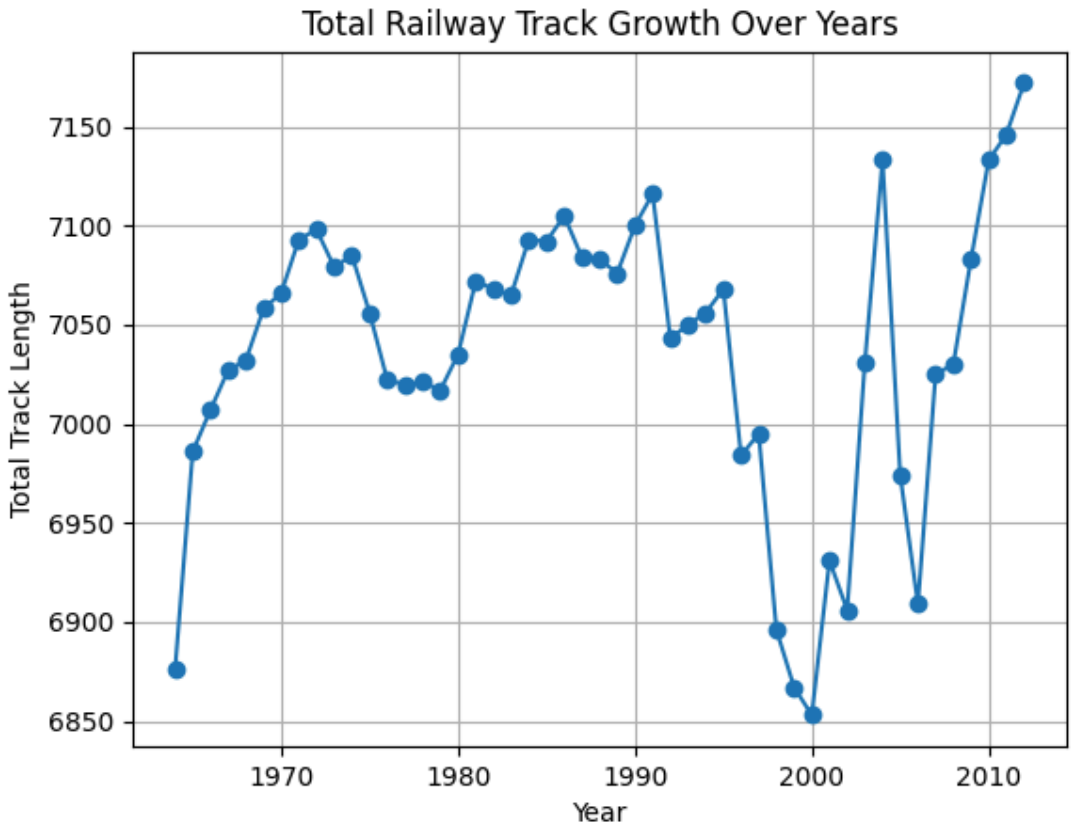
Conclusion:
The dataset was successfully loaded and inspected for structure and quality. Missing values were identified and replaced to avoid errors in analysis. All gauge-related columns were converted into numeric format for consistency. These steps ensured that the dataset is clean and ready for further operations. Proper preprocessing improves the reliability of results. This forms a strong foundation for the entire project.

Scenario 2: Simple Visualization (🟢 Easy)

Description:
This scenario focuses on visualizing the overall railway network growth over time. The Year and Total columns are extracted for analysis. Data cleaning is applied to ensure proper numeric conversion of values. A line graph is plotted to observe trends across years. Titles and labels are added to improve readability.

Task	Description
1.	Extract the Year and Total columns.
2.	Plot a line graph showing **Total** tracks over the **Years**.
3.	Add a descriptive title (e.g., "Growth of Total Railway Network Over Time") and X/Y axis labels.
4.	Identify whether the overall trend is increasing or decreasing and note the finding.

Graph:
A line graph is used to display Total railway track length over the years. The X-axis represents the Year and the Y-axis represents Total track length. Markers are used to highlight data points clearly. The graph shows a continuous upward trend. Grid lines improve readability. This visualization helps in understanding long-term growth patterns.



Conclusion:
The line graph clearly shows an increasing trend in total railway track length. This indicates consistent expansion of the railway network over time. The growth suggests infrastructure development and improved connectivity. There are no major declines observed in the dataset. The visualization confirms steady progress. Overall, the railway network has grown significantly.

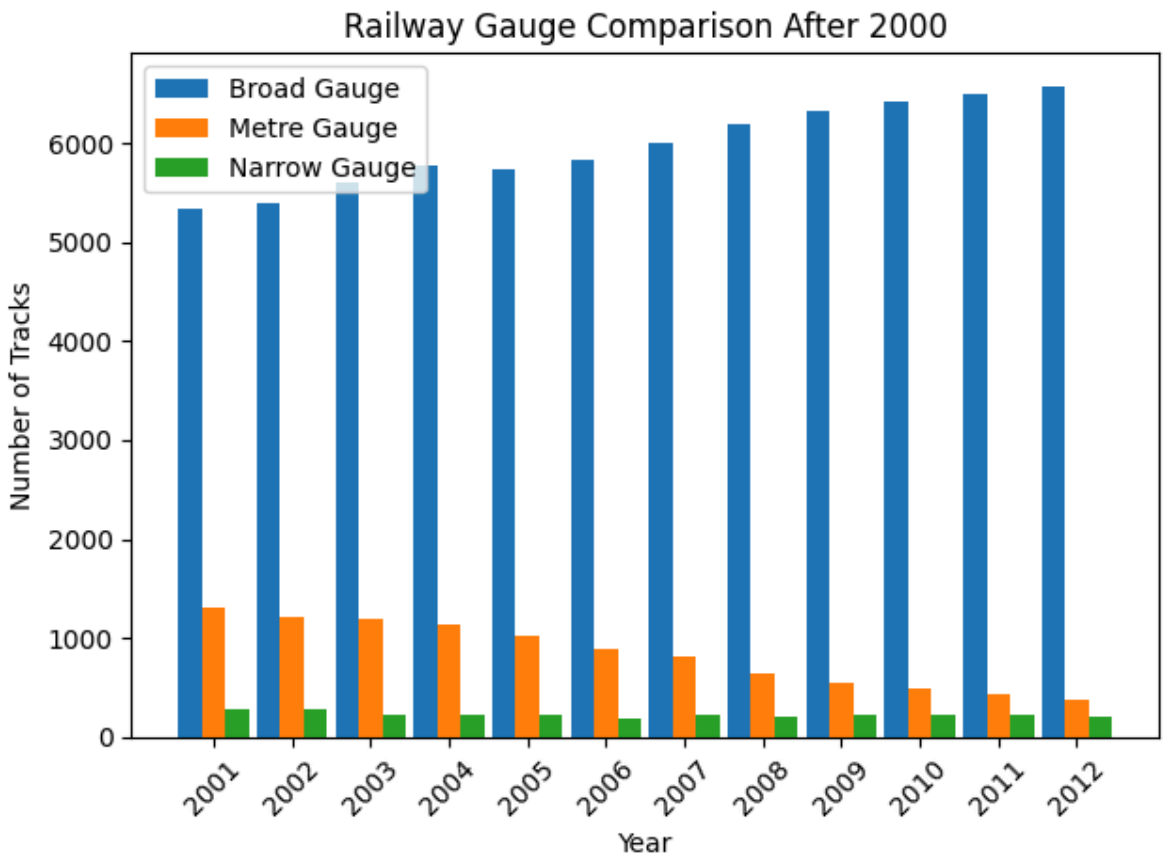
Scenario 3: Filtering + Bar Chart (🟡 Medium)

Description:
This scenario focuses on comparing different railway gauges after the year 2000. The dataset is filtered to include only recent years. Key gauge columns are selected for comparison. A grouped bar chart is used to visualize differences between gauges. Proper labels and legends are added for clarity.

Task	Description
1.	Filter the dataset to include only years *after* 2000.
2.	Select the Broad Gauge, Metre Gauge, and Narrow Gauge columns for the filtered data.
3.	Plot a **grouped bar chart** comparing the three gauges for the selected years.
4.	Add a legend and ensure proper labels for axes.
5.	Identify which gauge dominates in recent years (post-2000).

Graph :

A grouped bar chart is plotted to compare Broad, Metre, and Narrow gauges. Each group represents a year after 2000. Different colors distinguish each gauge type. The X-axis shows years, and the Y-axis shows track length. The bars clearly show differences in magnitude. This graph helps in identifying the dominant gauge visually.



Conclusion:

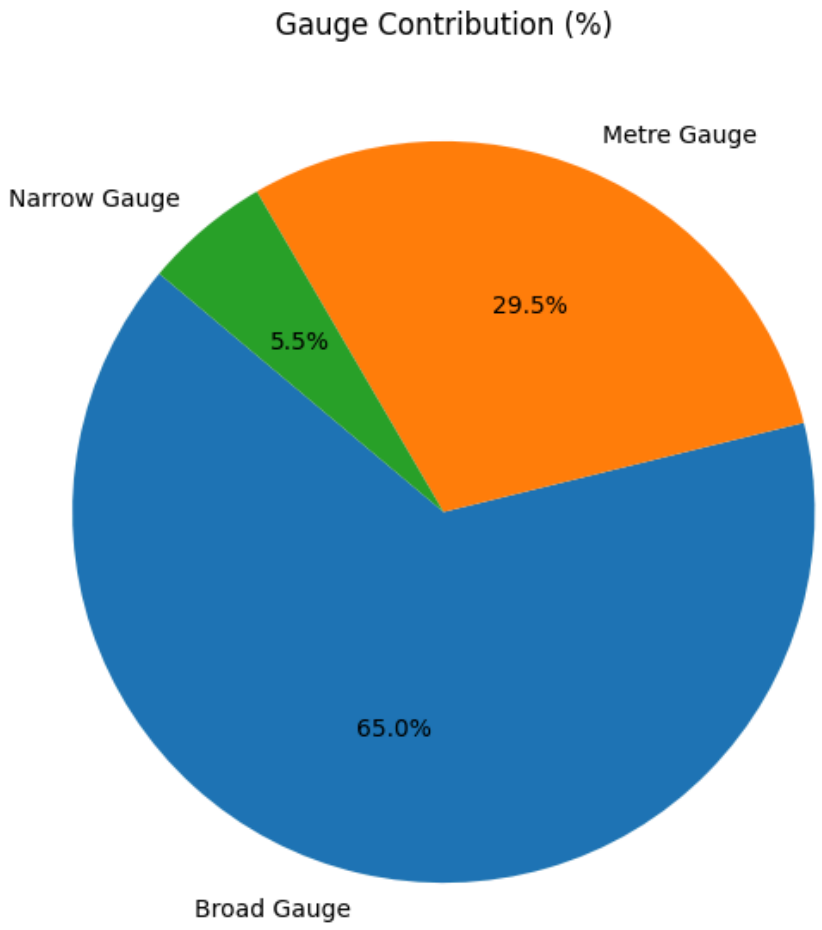
The grouped bar chart shows that Broad Gauge dominates in recent years. Metre and Narrow gauges have significantly lower values. This indicates a shift towards standardization. The dominance of Broad Gauge suggests modernization efforts. Older gauge types are gradually being reduced. The railway system is becoming more uniform.

Scenario 4: Feature Engineering + Pie Chart (🟡 Medium)

Description:
This scenario involves feature engineering and percentage analysis of gauge contributions. The total length of each gauge type is calculated across all years. A new structure is created to store these totals. A pie chart is used to represent their proportional contributions. Percentage labels are added for better interpretation.

Task	Description
1.	Calculate the total sum of each gauge (Broad Gauge, Metre Gauge, Narrow Gauge) across all available years.
2.	Create a new structure (Pandas Series or single-column DataFrame) holding these three total values.
3.	Plot a **pie chart** using this new structure to show the percentage contribution of each gauge type.
4.	Add percentage labels to the slices using autopct (e.g., '%.1f%%').
5.	Interpret which gauge contributes the most to the entire history of the railway network.

Graph :
A pie chart is used to display the percentage contribution of each gauge. Each slice represents a gauge type. Labels and percentages are shown on the chart. The chart visually highlights the dominant gauge. Colors help distinguish different sections. This provides a quick summary of overall composition.



Conclusion:
The pie chart shows that Broad Gauge has the highest contribution. Metre Gauge and Narrow Gauge occupy smaller portions. This indicates long-term dominance of Broad Gauge. The distribution confirms a shift toward a single gauge type. The visualization simplifies comparison effectively. Broad Gauge plays a major role in the railway network.

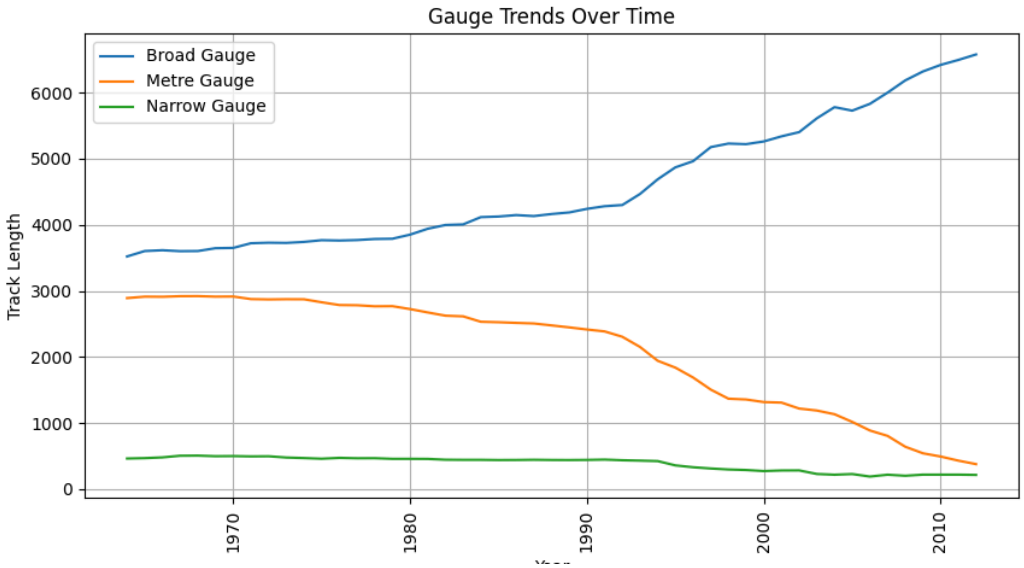
Scenario 5: Advanced Analysis + Multiple Graphs (🔴 Hard)

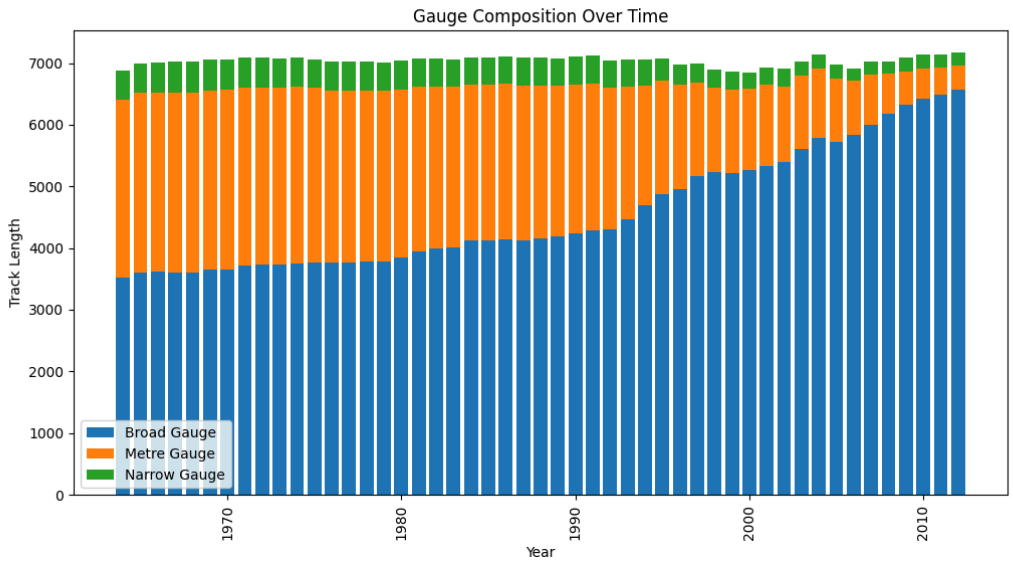
Description:
This scenario focuses on advanced analysis and multi-visualization techniques. New percentage columns are created to analyze gauge composition. NumPy is used to calculate yearly growth in total tracks. Multiple graphs are plotted, including line and stacked bar charts.

Task	Description
1.	**Create new columns** for percentage composition relative to Total tracks for each year: % Broad Gauge, % Metre Gauge, and % Narrow Gauge.
2.	Use the NumPy function np.diff to calculate the **yearly growth (change)** of the Total tracks column.
3.	Plot: a) A single **Line Graph** showing the trend of all three percentage composition columns (% Broad Gauge, % Metre Gauge, % Narrow Gauge) over the years. b) A **Stacked Bar Chart** showing the raw composition of the three gauges (Broad, Metre, Narrow) over time.
4.	**Highlight/Identify:** a) The year(s) with the highest yearly growth in Total tracks. b) Any specific decade or period showing a significant decline in any particular gauge.
5.	**Final Conclusion:** Based on the percentage composition line graph, provide a conclusion to the question: **"Is the railway system shifting towards a single dominant gauge?"**

Graph:

A line graph shows trends of different gauges over time. A stacked bar chart displays their combined *composition*. The X-axis represents years and Y-axis represents track length. Different colors represent each gauge type. The stacked view shows how each contributes to the total. These graphs together provide both trend and distribution insights.





Conclusion:
The analysis shows that Broad Gauge is steadily increasing over time. Metre and Narrow gauges are declining in multiple years. The highest growth years indicate rapid infrastructure expansion. The stacked chart confirms the dominance of Broad Gauge. The system is clearly moving toward a single standard. This reflects modernization and efficiency improvements.

Final Conclusion:

The project demonstrates a complete data analysis workflow from preprocessing to advanced insights. Railway data shows a clear growth trend over the years. Visualizations confirm the dominance of Broad Gauge. Older gauge types are gradually declining. The system is becoming more standardized and efficient. Overall, the railway network is expanding with a focus on a single dominant gauge.

What you have learned

Through this project, I learned how to clean and preprocess real-world datasets. I gained experience in using Pandas for filtering and data manipulation. I understood how to use NumPy for numerical calculations like growth analysis. I created multiple visualizations such as line graphs, bar charts, and pie charts. I learned how to interpret trends and patterns from data. This project improved my overall data analytics and visualization skills.
